Analysis Report 23.04016.01

Required tests :

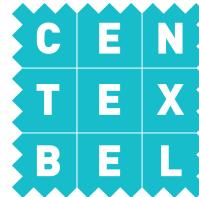

Centexbel	Cryogenically ground
Centexbel	Determination of the elemental composition (screening)
Centexbel	Determination of the composition using XRF-screening
Centexbel	LCMS screening (Reach SVHC)
Centexbel	Determination of the emission profile by thermal extraction.

Sample id	Information given by the client	Date of receipt
T2317019	SAMPLE URAL BLACK GOVAPLAST	19-07-2023

Stijn Steuperaert
Order responsible

This report may be reproduced, as long as it is presented in its entire form, without written permission of Centexbel.
The results of the analysis cover the received samples. Centexbel is not responsible for the representativeness of the samples.
In assessing compliance with the specifications, we did not take into account the uncertainty on the test results.

The method is used to screen for the presence of organic REACH SVHC compounds (17-01-2023)*.

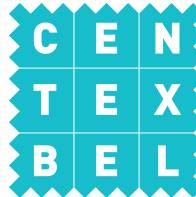

The results for the specific substances show that the sample does not contain the (mainly organic) compounds* on the Reach candidate list (substances of very high concern), in concentrations >0.1 mass%.

Presence of a limited amount of bisphenol A, which will however not lead to the 1000mg/kg Reach SVHC limit value.

Determination of the emission profile by thermal extraction.

Date of ending the test	07-08-2023
Method used	Centexbel
Product standard	Reach SVHC_17-01-2023
Sample preparation	One or more 1 cm diameter samples are heated in a glass tube at a fixed temperature under an inert gas flow. The gas flow is lead over a tenax filled tube where volatile organic compounds (VOC's) are trapped. The tenax tube with the VOC's is thermally desorbed. Released VOC's are cryo trapped and injected into a GCMS.
Temperatuur	120°C
Time	30'
Analytical method	Gas chromatography with Agilent MSD detector

Results

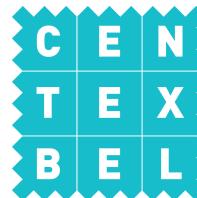

As conditions 120°C and 30' were used. These relate to the conditions used eg in VDA 278 to evaluate fogging behaviour of plasticisers. For the more volatile VOC's semi-quantitative results ($\mu\text{g/g}$) can be obtained while for the heavier VOC's and SVOC's it is a screening method for their presence. If present in higher concentrations only part of the products have already evaporated (results as ng/min.g).

Specific screening for substances indicating possible presence of Reach SVHC compounds (17-01-2023)*

The results for the specific substances show that the sample does not contain the compounds* on the Reach candidate list (substances of very high concern), in concentrations >0.1 %.

Presence of a limited amount of formamide, which will however not lead to a concentration above the 0.1% limit value for Reach SVHC substances
